

Head Restraint Products

These types of product are generally used to restrain the tops of free-standing walls by tying them securely to an overhead structure, so preventing sideways movement.

VIR

The VIR head restraint is designed to resist lateral movement in wall heads, restraining them to structural soffits whilst allowing vertical movement (in order, for instance to accommodate beam deflection).

VHR

The VHR is a very simple, economical head restraint product, twice holed to accommodate 100 or 140mm walls. Vertical movement can be accommodated only by allowing clearance between the top of the blockwork panel, and the underside of the restraint angle.
